Abstract

Diffuse large B cell lymphoma is the most common subtype of non-Hodgkin lymphoma. Since most DLBCL presents positive CD20, CD20-negative DLBCL constitutes only 1.7% of patients, furthermore, only a minority of patients with DLBCL demonstrate positivity of CD5, nearly 10%. Here, we report a rare case with de novo primary DLBCL, demonstrating positivity of CD5 but absence of CD20, and also has the special presentation as primary hepatosplenic involvement.
