摘要：

This 41 year-old male patient has medical history of: 1. HIV infection, under HAART 2. Syphilis. He had nausea and vomiting one week before admission. Then loose stool, yellowish skin and tea color urine were noted. Besides, there was significant body weight loss (10 kgs in 2 months). After admission, blood exam showed jaundice, elevated liver enzyme and acute hepatitis A infection. Endoscopic exams also revealed amebic colitis and gastric ulcers. Then supportive treatments with Silymarin and Glycyrrhizin were given and HAART continued. Patient's symptoms subsided and level of jaundice and liver enzymes improved gradually. He was discharged after 9-day hospitalization.
