Abstract:

GISTs are the most common mesenchymal tumors of the GI tract, but accompanied with another malignancy was less reported. We report an unusual case of synchronous appearance of GIST and adenocarcinoma in stomach, who initially presented with gastric outlet obstruction. The computed tomography showed a big heterogeneous tumor in gastric body. The endoscopy was done to check the lesions, and reported an irregular ulcer at antrum with pylorus ring deformity and a submucosal tumor at body. Total gastrectomy was performed to relieve his obstruction signs.
