Abstract:

Pneumocystis jirovecii pneumonia (PJP) is a potentially fatal opportunistic fungal infection, that occurs in immunosuppressed patients. Golimumab is a biologic agent that neutralizes TNF-alpha activity. With the increased utility of biological therapy, the most associated biological DMARDs with PJP was Infliximab, but yet PJP associated with golimumab has not been reported in the medical literature. Hereby, we describe the case with rheumatoid arthritis who developed severe *Pneumocystis jirovecii* pneumonia (PJP) under treatment with Golimumab.
